Abstract (en)
[origin: WO2017198282A1] A centralized access system (100) is used for managing access of users to a plurality of distributed facilities, for example, a plurality of shared office spaces provided at geographically different locations. Each user has an access device (16) such as a smartcard including a unique ID associated with the user. A user can subscribe to obtain access to one or more of the plurality of office spaces for a period of time, and each office space may include a plurality of electronic locks that are connected to a central server (14) of the system. The server (14) may then control the respective locks (21) such that the user has access to the office space, and any services provided therein, at the location and the time that has been booked.
