Abstract (en)
The object of the present invention is a blocking device (1) for casings (100) comprising: a body (3) that is removably engageable with a supporting surface (102), a bracket (7) pivoted on the body (3) so as to be able to adopt with respect to said body (3) an operative position and a rest position and a pusher (8) partially housed in a seat (39) of the body (3) so as to be able to translate with respect to the body (3). According to the present invention, the blocking device (1) further comprises a lever (9) pivoted on the bracket (7), the lever (9) and the body (3) comprise reciprocal hooking means (9a, 3a) that are suitable for maintaining the bracket (7) in the operative position, the lever (9) and the pusher (8) comprise reciprocal abutment means (9b, 8b) that are suitable for implementing rotation of the lever (9) with respect to the bracket (7) by an amount that is such as to disengage the hooking means (9a, 3a) and consequently cause the bracket (7) to switch from the operative position to the rest position.
