Abstract (en)

[origin: WO2016154285A1] A system (300) for controlling vibratory motion in a vehicle steering wheel (20) prone to oscillate in a given direction due to extraneous inputs at one or more frequencies. The system (300) has a steering wheel (20) of the type exhibiting a vibratory motion along a defined axis at one or more frequencies, at least one sensor for sensing the acceleration of the steering wheel (20) along the defined axis and an active control mechanism responsive to the output of the at least one sensor. The sensor is an accelerometer having a movable first mass (70) and a solenoid coil (56) which when activated moves the mass (70) in a direction opposite to the motion of the steering wheel (20) and at the frequency of motion of the steering wheel (20).
