Abstract (en)
An industrial plug with phase inverter device including a core which is inserted in a casing and supports a plurality of pins; a rotor that is mounted on the core and supports at least two movable pins and is arrangeable in two preset positions: an initial position and a final position; the initial and final positions corresponding to a rotation through 180° of the rotor so that the position of the movable pins is reversed; the plug includes a means for highlighting the reaching of one of the preset positions of the rotor and therefore of the movable pins. The phase inverter device highlights uniquely and objectively the reaching of the correct position on the part of the pins, once they have been reversed.
