Abstract (en)

[origin: WO2016156750A1] According to the method, an elongate element (20) is formed from a composite material and a coil is formed by winding the elongate element (20) around a master model (24). The master model (24) provides the coil with the general shape of a continuous ring and with dimensions that allow the resulting coil to form an insert (2) equipped with at least two parts that are intended to extend through at least two separate opening panel zones to be reinforced.
