Abstract (en)

[origin: WO2016180844A1] The invention relates to a system for transmitting video data from a server to a client. The system has a first coding unit, which is designed to transmit video data of a first quality from the server to the client in the form of a livestream, and a second coding unit, which is designed to store the video data in a second quality in a storage unit (13) and to transmit the coded video data in the second quality from the storage unit (13) to the client (2) in response to a request signal from the client (2), wherein the second quality is greater than the first quality. The proposed system allows video data to be transmitted from a medical environment, for example an operating room, to an external expert via a network. The video data in the form of a livestream is provided in a low quality and can additionally be provided in a high quality upon request by the expert. The invention further relates to a method for transmitting video data from a server to a client.
