Abstract (en)
[origin: EP3279126A1] The invention relates to an elevator apparatus comprising: - a traveling assembly (1), - a shaft (3) where the traveling assembly (1) can be displaced, - a shaft element (4) which at some point of the path of the traveling assembly (1) is located in a space between a wall (3') of the shaft (3) and said traveling assembly (1), and - covering means (5) located in the traveling assembly (1) which can be displaced between an active position and an inactive position, such that the minimum distance between the wall (3') of the shaft (3) and the covering means (5) in the active position is smaller than in the inactive position, where the covering means (5) automatically switch from the active position to the inactive position when the traveling assembly (1) is located in its path next to the shaft element (4).
