Abstract (en)
[origin: WO2016162531A1] The invention relates to a key (1) for a rotary lock cylinder (2), comprising a key grip (3) and a key shaft (4) which adjoins the key grip (3) and extends along a longitudinal axis (L), wherein the key shaft (4) has control recesses (6), in particular control bores, on its outside (5) for properly positioning tumblers on the rotary lock cylinder (2) and also has at least one control element (7) which is movably arranged in the key shaft (4), said control element (7) having a control surface (9) which interacts with a tumbler (8) of the rotary lock cylinder (2). The key shaft (4) has a recess (10) which is designed in such a way that a manipulation element (11) of the rotary lock cylinder (2) can act on the control element (7) via the recess (10) when the key (1) is inserted into the rotary lock cylinder, such that the control element (7) is movable with respect to the key shaft (4) and the tumbler (8) can be brought into the release position.
