Abstract (en)
[origin: WO2016162462A1] The invention illustrates and describes a patchboard comprising a plurality of socket blocks (2), wherein the individual socket blocks (2) each have a box-like housing (3) with two end faces (4a, 4b) and four side faces (5a, 5b, 5c, 5d) which extend between the end faces (4a, 4b), and wherein the two end faces (4a, 4b) of the socket blocks (2) each have at least one connection region (6). The patchboard (1) according to the invention has an increased degree of flexibility and ability to adapt to individual requests of a user as a result of at least two side faces (5a, 5b, 5c, 5d) of the socket blocks (2) each having at least one latching element for connection to another socket block (2), and by at least one termination element (11) being arranged on at least one side of the patchboard (1), wherein the termination element (11) has a mating latching element on at least one side face (12a, 12b), the termination element (11) being connected to an adjacent socket block (2) by means of said mating latching element.
