Abstract (en)

[origin: EP3285423A1] A method and apparatus for code block division are provided. The method may include the following acts. A reference information packet length of a code block is determined according to an obtained division related parameter. A maximum information packet length is determined according to the reference information packet length and a hardware parameter. A Transfer Block (TB) having a length greater than the maximum information packet length may be divided into two or more code blocks according to the obtained division related parameter, the hardware parameter and the determined maximum information packet length. An information length after code block division is less than the determined maximum information packet length. In the method of the solution, the maximum information packet length for code block division may be determined according to the obtained division related parameter, so as to perform code block division, thereby reducing the delay brought by the code block division to a system, avoiding influences on the work of the system due to the delay caused by the code block division, and improving system performance.
