Abstract (en)

[origin: US2016317419A1] Cosmetic methods of increasing ARE activated gene transcription in a skin cell by contacting skin cells in a target portion of skin with an effective amount of niacinamide and nicotinamide riboside in combination to increase ARE activated gene transcription or synergistically increase ARE activated gene transcription of at least some of the skin cells contacted with the niacinamide and nicotinamide riboside. The cosmetic methods also enable synergistic reduction of ROS-induced adenosine triphosphate (ATP) depletion in a skin cell and restoration of glycolytic ATP production rate in a skin cell that has been reduced as a result of ROS-induced oxidative stress.
