Abstract (en)

[origin: WO2016174135A1] A linkage (1) for the articulated connection of a vehicle-body-side end region of a coupling rod (2) to a vehicle body (3). The invention relates to a linkage for the articulated connection of a vehicle-body-side end region of a coupling rod to a vehicle body of a rail-bound vehicle, wherein a longitudinal axis of the coupling rod coincides with the longitudinal direction of the rail vehicle in the neutral position, and wherein the linkage has the following: a base plate (4) which is coupled in a positionally fixed manner to the bearing bracket (16), which is connectable to the vehicle body, and in which a passage opening (5) is formed, through which a vehicle-body-side end region (6) of the coupling rod is guided in an extending manner, and a pull/push device (7) which is arranged in the vehicle-body-side end region of the coupling rod and has a vehicle-body-side supporting element (10) arranged between base plate and vehicle body, and a coupling-side supporting element, wherein respective spring units (8.1, 8.2) are arranged between base plate and the respective vehicle-body-side and coupling-head-side supporting elements (9, 10). The invention is characterized in that the base plate is mounted in the bearing bracket so as to be pivotable in a horizontal plane transversely with respect to the longitudinal direction, and the coupling rod is mounted in the through opening via a spherical bearing (11), in particular a ball-and-socket joint bearing.
