Abstract (en)

[origin: WO2016174089A1] Said stopper (1) comprises a generally tubular skirt (20) suitable for surrounding a neck (2) of a container (3). Said skirt is provided on the inside with clipping means (22) for removably fastening the skirt to the neck by jamming engagement with a raised outer boss (7) of the neck of the container. Said stopper further comprises an annular opening strip (30) of which a peripheral portion (32) is fixedly connected to a peripheral portion (24) of the skirt: said strip can be moved relative to the skirt between a first position, in which the strip surrounds a lateral outer surface (20A) of the skirt, providing an annular space radially between said lateral outer surface of the skirt and an inner surface of the strip, and a second position, in which the inside of the strip is substantially released from the skirt to allow a user to manually grip the strip in order to move the skirt to unclip same from the neck of the container.
