Abstract (en)  
The invention refers to a rucksack (1) that comprises a container part (2), a back (3) of the rucksack, at least one shoulder strap (4), a lumbar support (5) that is connected by means of an articulated joint (6) with the lower part of the back of the rucksack, wherein the articulated joint (6) provides for a limited movement of the lumbar support (5) around the joint in all three rotational degrees of freedom with respect to the back (3) of the rucksack and in one linear degree of freedom. The articulated joint (6) is provided with at least one spring. An advantage of the rucksack with the lumbar support of the invention over known solutions lies in that the lumbar support allows perfect adjustment to the user's lumbar area while he is walking.
