Abstract (en)  
[origin: WO2018041671A1] The invention relates to a planetary transmission (1), in particular for a wind turbine, comprising a transmission housing (2), a central sun gear (5) which is retained in the transmission housing (2) such that it can rotate about a central transmission rotational axis (37) and which has an outer toothing (6), a ring gear (7) which is arranged concentrically in relation to the central transmission rotational axis (37) in the transmission housing (2) and which has an inner toothing (8), a one-sided planetary carrier (9) which is mounted in the transmission housing (2) such that it can rotate about the central transmission rotational axis (37), and multiple planetary gears (13) which are mounted on the planet carrier (9) by means of a planetary gear bearing (12) configured as a sliding bearing such that they can rotate about planetary gear rotational axes (36) and which have outer toothings that engage with the inner toothing of the ring gear and the outer toothing (14) of the sun gear, wherein every planetary gear bearing (12) has two annular bearing bodies (12a, 12b) which are penetrated by a planetary gear shaft (11) and are rotationally fixed on same, and which have conical sliding surfaces (16a, 16b) formed on the outer circumferential surfaces thereof in such a way that the tapered ends of the bearing bodies (12a, 12b) point towards one another, wherein running surfaces (20a, 20b) corresponding to the sliding surfaces (16a, 16b) of the planetary gear bearing (12) are formed on inner circumferential surfaces of the planetary gear (13).
