Abstract (en)

[origin: WO2016184657A1] The invention relates to a book block for a book-like document and to a book-like document with a number of data pages (18) lying one on top of the other, which are connected to one another along a folding edge (34) and along the folding edge (34) form a book block spine (31), or with one side edge are aligned congruent to one another and are connected to one another and form a book block spine (31), wherein a clamp element (32), which reaches around the spine of the book, acts on an outer side of the upper and lower data page (18) or on an outer side of the endsheet (14) that covers the upper and lower data page (18). Such a clamp element is formed in an elastically compliant manner, allowing an individual data page to be opened. The opening of individual data pages or of the endsheet causes restoring forces to be produced in the clamp element, and so, when the data pages or the endsheet are/is let go, this restoring force has the effect that the book block is closed again and transferred into a folded arrangement.
