Abstract (en)
[origin: WO2016182499A1] The invention provide a system (1) for transporting object (2a, 2b) from a sea level position (A1) to an elevated position (B) on a structure (3), wherein the sea level position (A1) is movable in relation to the elevated position. The system (1) comprises an elongated guide device (4) configured to be arranged to the structure (3) in one end and to extend below the sea level with a second end, an attachment device (5) configured to be arranged on said object (2a, 2b) and for attaching said object (2a, 2b) to the elongated guide device (4), wherein the attachment device (5) is configured to allow a relative movement between the attachment device (5) and the elongated guide device (4) along a first direction parallel to the extension direction of the guide device and a lifting device (8) configured to transport the object (2a, 2b) from the sea level position to the elevated position. The system is characterized in that a weight (6) is arranged to the second end of the guide device (4) below the sea level for stabilizing the guide device (4), wherein the second end is a free end and the weight (6) s a free weight.
