Abstract (en)  
[origin: US2018000227A1] An applicator assembly for a cosmetic product capable of occupying two positions including an opened position and a closed position is described herein. The applicator assembly includes a bottle without a neck, a wiper intended to scrape the excess cosmetic product from an applicator, and assembly means including at least one positioning means and at least one means for retaining the wiper in position on the bottle, the assembly means being intended to interact, at the proximal end of the bottle, so as to prevent a withdrawal movement of the wiper when the applicator passes into the bottle. As well, the inner surface of the wiper is designed to be in direct contact with the applicator when the applicator assembly passes from an opened position to a closed position and the wiper includes the assembly means.
