Abstract (en)

[origin: US2018079100A1] In an embodiment, the present invention provides an electrically operated slicer for cutting slices, particularly of strand-like cutting material, preferably foodstuffs, including: a cutter that includes a circular blade driven by a blade motor, rotating about an axis of rotation in a slicing plane and mounted in a motor housing, having a stop plate for adjusting a slicing thickness which can be displaced in a direction of the axis of rotation and which is arranged parallel to the slicing plane; and a carriage carrying a support plate via a carriage foot, wherein the carriage foot can be displaced along one side of the motor housing running parallel to the slicing plane, the support plate including a support surface receiving the cutting material arranged perpendicular to the slicing plane on a horizontal plane, the carriage being guided so as to move via a carriage guide having at least two supporting elements.
