Abstract (en)  
[origin: EP3296179A1] A railway vehicle includes a high roof structure body (36) and a low roof structure body (34), and conditioned air generated by an air conditioner is supplied to inside of the vehicle through an air conditioning duct (80) via air conditioning ducts (92, 93). This air conditioning duct (80) is made up of a circular channel material having an opening surface toward a ceiling panel (83b) arranged below the low roof structure body (34) and the ceiling panel (83b) provided to cover this opening surface. In addition, an ejection port for ejecting air in a substantially horizontal direction toward a center portion of the air conditioning duct (80) so as to cross a flow direction of the conditioned air is provided between the channel material and the ceiling panel (83b).
