Abstract (en)

[origin: WO2016185110A1] The invention concerns a device (100), a method and a system for issuing real-time receipts, said device (100) being connected to a point-of-sale terminal (T) sending it a command to print data representative of said receipt. The device (100) is further connected to a printer (I), in such a way as to allow said command to print said data representative of the receipt to be transferred to said printer (I). The device (100) makes it possible to convert said data representative of the receipt, originating from said point-of-sale terminal (T), into a digital file representative of said receipt. The device then transmits the digital file representative of the receipt, previously associated with an identification number, to a remote storage network (200) accessible via a mobile telephone network of a mobile terminal (M) with which it communicates according to a contactless communication protocol.
