Abstract (en)

The present invention relates to a train-centric electronic interlocking system and method for an autonomous train control system based on connection between trains. The train-centric electronic interlocking system is simplified based on the onboard EIS without wayside EIS facilities, whereby installation and maintenance costs of the system can be reduced. A control path can be simplified and can flexibly reply to operational change by providing onboard facilities that were used as wayside facilities in a conventional wayside-centric wireless communications-based train driving safety system.
