Abstract (en)
[origin: EP3300098A1] A time switch device (1) has: a casing (2); a first electronic module (12) having a first processing unit (16) for managing a programming; and a second electronic module (14), distinct from the first electronic module (12) and housed together with the first electronic module within the casing, having: a second processing unit (20) communicatively coupled to the first processing unit; a switching unit (22) comprising at least one switch element, coupled to the second processing unit (20) and to a switching output (7); and a driving unit (24) coupled to the second processing unit (20) and to an analogue driving output (8) having analogue circuits for providing a number of driving signals (S 1 , S 2). The first processing unit (16) generates, based on the programming, a control signal (S c) for the second processing unit (20), which selectively activates the at least one switch element and generates driving signals (S1, S2) based on the control signal (S c).
