Abstract (en)
[origin: EP3300331A1] Embodiments of the present invention relate to a response method, apparatus, and system in virtual network computing authentication, and a proxy server. The method includes: receiving, by a proxy server, a password sent by a controller, receiving challenge information sent by a serving end, where the challenge information is generated by the serving end based on the virtual network computing authentication, determining a first response value according to the password and the challenge information, and sending the first response value to the serving end, so as to resolve a problem in the prior art that sensitive data of a user is leaked or decrypted by brute force because a response process in the virtual network computing authentication is completed by a client, thereby improving security in the virtual network computing authentication process.
