Abstract (en)  
[origin: WO2016195484A2] The invention relates to a pellet press (1) with a supporting shaft (2) and a perforated drum mounted rotatably thereon via a drive member (8) having two spaced-apart bearings (9, 11). A single roller (15) is provided on the shaft within the drum. The first bearing (11) of the drive member (8) is a radial bearing, the second bearing (9) of the drive member (8) is an axial-radial bearing situated at a larger radial distance Bi from the drum rotation axis (6) than the radial bearing. An axially movable locking bushing (12) is placed around the shaft (2) between the bearing housings (10, 13) of the axial and the axial-radial bearings, the bushing (12) engaging both casings (10, 13).
