Abstract (en)

[origin: WO2016192835A1] The invention relates to, inter alia, an air conditioning device (10) comprising a heat exchanger (40) on a low-pressure side (11) of the air conditioning device (10) and a heat exchanger (60) on a high-pressure side (12) of the air conditioning device (10). A cooling medium (M) which can be found in a cooling circuit (20) of the air conditioning device (10) is under a higher pressure on the high-pressure side (12) than on the low-pressure side (11). According to the invention, the heat exchanger (40) is arranged in a first housing portion (81) of the air conditioning device (10) on the low-pressure side (11), and the heat exchanger (60) is arranged in a second housing portion (82) of the air conditioning device (10) on the high-pressure side (12). A smoke removal opening (400) is arranged between the first and the second housing portion (81, 82), and the smoke removal opening is closed during the normal operation of the air conditioning device (10) and can be opened in the event of a fire and allow a flow of air from the first housing portion into the second housing portion (81, 82).
