Abstract (en)

[origin: WO2016189035A1] The method of operation of an autonomous system (10) comprising a photovoltaic generator (11) arranged so as to supply a main load (12) tends to optimize the photovoltaic solar energy recovery. The main load comprises, a primary load (20) arranged in series with a secondary load (30); a first interrupter system (31) arranged in such a way as to disconnect the secondary load (30) from the main load (12). The method comprises the following steps: - measuring at least one electrical quantity (Am) chosen from among: an output current intensity (I11) of the photovoltaic generator (11), a voltage across the terminals (U11) of the photovoltaic generator (11), and a voltage across the terminal (U20) of the primary load (20); – comparing the measured electrical quantity (Am) with a first threshold value (As1); – actuating the first interrupter system (31) as a function of the result of the comparison.
