Abstract (en)

[origin: CA2986618A1] The invention relates to a method for providing a personal identification code (ID) of a security module (1), wherein the personal identification code (ID) is associated with the security module (1) and there is a server (4) provided which a user of the security module (1) is able to access following an authentication. The method involves, on initiation by a request (RE) from the user on the server (4), an authentication code (AV) being transmitted to a terminal (2) of the user by means of a first message (N1). An authentication code that is input by the user is received on the server (4), and a check is then performed to determine whether the input authentication code matches the authentication code (AV) that has been transmitted to the terminal (2), the personal identification code (ID) being transmitted to the terminal (2) of the user by means of a second message (M2) in the event of a match.
