## Abstract (en)

[origin: WO2016197170A1] The invention relates to a stamp (1) comprising at least one stamp component (2) and a printing unit (3), the stamp component (2) being formed by an upper part (4) and a lower part (6) having a pad-receiving element (7). The impression unit (3) is connected in terms of movement in the lower part (6) via an axle (12) or an axle piece (12), to the upper part (4) by means of a turning mechanism (11) which has a guide track (17). In the rest position (13), a text plate (15) mounted on the printing unit (3) rests against an ink-impregnated stamp pad (16) in the pad-receiving element (7). During the stamping process for producing a stamp print in the position of stamping (14), the printing unit (3) with the text plate (15) can be displaced to the stamp position (14) by means of the turning mechanism (11). The entire printing unit (3), in particular the text plate support (20) and/or the mounted-band unit (19) or data unit is arranged so that it can be exchanged with an axle (12) or an axle attachment (12) or axle stub. The invention also relates to a printing unit (3).
