Abstract (en)

[origin: WO2016198640A1] A device for determining the presence of an identifier (I) in a zone associated with a vehicle (V) and equipped with two beacons (B1, B2) comprises an analysis module which evaluates, by means of each of the two beacons (B1, B2), the distance (b; c) separating the identifier (I) and the beacon concerned (B1; B2). The analysis module concludes the presence of the identifier (I) in said zone if the sum of the two distances evaluated (b, c) is less than a predetermined value (S). A method of determining the presence of the identifier and an associated computer program are also described.
