Abstract (en)  
[origin: WO2016198175A1] The aim of the invention is to ensure during the braiding of braiding cores, which have a complex braiding core geometry, for example a rectangular braiding core cross-section or one-sided cross-sectional changes, that the braiding threads are always correctly following the braiding core contour in terms of storage. According to the invention, a braiding ring is provided, which is composed of a number of adjustable segments, each of which can be actuated individually and independently of the other segments by an actuator.
