Abstract (en)
[origin: WO2016202864A1] Shown and described is a dispenser system for fastening on a vertical wall, said dispenser system having a replaceable bottle (33), which extends along a longitudinal axis (37), which comprises a bottle body (35) with a circumferential wall (61) which is provided with oppositely situated recesses (63, 65), and having an actuating device (3) which includes a support housing (5) and a lever arm (7) which is hinged on the support housing (5), wherein the support housing (5) comprises an abutment surface (9), two side walls (19, 21) which are spaced apart from one another and an open front side (29) which is situated opposite the abutment surface (9) such that a receiving region (31) for the bottle (33) is formed between the side walls (19, 21). The object to provide a dispenser system with which bottles can be received simply and supported securely is achieved in that the side walls (19, 21) comprise side projections (23, 25) which are provided on oppositely situated inside surfaces, in that the support housing (5) is developed in such a manner that the bottle (33) can be inserted into the receiving region (31) from the front side (29) as a result of a movement substantially perpendicular to the abutment surface (9), and in that with the bottle (33) inserted, the side projections (23, 25) engage with the recesses (63, 65) in the circumferential wall (61) of the bottle (33), and in that with the bottle (33) inserted, the longitudinal axis (37) of the bottle (33) is in a position inclined forward with respect to the abutment surface (9).
