Abstract (en)  
The invention relates to a heat recovery system (1) for installation in a conduit for hot fluid flowing from a heat generating process to the exterior environment. A housing (2) of the system encapsulates an interior space with a first and a second section (5,6), the first section extending between an inlet (3) and an outlet (4) of the housing. A heat exchanger (7) is arranged in the second section. The system comprises at least two dampers (8) movable between a first position (9) in which they are arranged to guide the hot fluid from the inlet to the outlet via the heat exchanger, and a second position (10) in which the first and second sections are separated by the dampers so that the hot fluid is guided from the inlet to the outlet without passing the heat exchanger (7). The dampers (8) have a thermally insulating construction so that when they are in the second position, the first and second sections of the interior space are thermally insulated from each other.
