Abstract (en)

[origin: WO2016207350A1] The invention relates to a home automation device, which includes: a central unit (20); a device (1) for detecting a movement of at least one peripheral access door (3); and a plurality of badges (12, 13); and wherein: said central unit (20) is suitable for receiving presence signals from each badge when said badge is present in a predefined perimeter (38); for each badge, said central unit (20) is suitable for storing presence data, representing a state of presence, referred to as present or absent state; when the central unit (20) detects a change in the state of presence of each badge and receives movement signals of each access door (3) in a time interval lower than a departure/arrival time, the central unit (20) is capable of storing movement data. The invention also relates to a method for controlling such a home automation device.
