Abstract (en)
[origin: US2019127195A1] The double lever corkscrew includes a spiral metal rod secured to a rack, a tubular body housing the spiral metal rod, and two subassemblies. Each subassembly includes a lever arm and a toothed wheel meshing with the rack. The lever arms are movable between a folded-back position against the tubular body and a position spaced away from the tubular body. For each subassembly, the device for attaching the lever arm to the toothed wheel is arranged to pass from an active state and an inactive state. There is a device for holding the device for attaching in their inactive state when the lever arms are positioned in their folded-back position against the tubular body.
