Abstract (en)  
[origin: WO2017001201A1] The invention relates to a bracket (12) in the form of a scaffolding bracket, in order to anchor a first vertical scaffolding part (14) of a scaffolding (10) to a building facade. The bracket (12) has a pincer (16) at one end in order to grip the first scaffolding part (14). The pincer (16) can be locked preferably in its closed position. Particularly preferably, the bracket (12) has a spring element which impinges the pincer (16) into the closed position of the pincer (16) with a spring force. The bracket (12) can have a first casing for actuating the pincer (16). The first casing can have a slotted guide, by means of which the first casing can be transferred from the closed position into the open position of the bracket (12). The slotted guide is also preferably formed in such a way that the bracket (12) can be locked in the closed position. In addition, the pincer (16) can have at least one projection (22, 24) for engaging in the first scaffolding part (14), in order to permit a particularly secure fastening of the bracket (12) to the first scaffolding part (14).
