Abstract (en)
The invention is directed to a process for the operation of a washing machine (1) with a tub (2) containing a drum (3) for receiving laundry (4) and a pressure sensor (6) in contact with an aqueous liquid, a drive motor (5) for the drum (3), a pump (18), and a control unit (8), wherein the presence of foam can be detected by a pressure change, characterized in that the following steps are carried out: (a) a washing phase is conducted with a suds containing water and detergent; (b) water is added during or after the washing phase (a) into the tub (2) in an amount $Q \neq Q_{set}$, wherein Q_{set} is a prescribed maximum quantity of water to be added in this step; (c) a change of the pressure P is measured by the pressure sensor (6) upon the addition of the water in step (b); and (d) the pressure change ΔP measured in step (c) is evaluated with respect to the presence of foam. The invention is moreover directed to a washing machine (1) in which this process can be conducted.
