Abstract (en)

[origin: WO2017008926A1] The invention relates to a method of determining an activation sequence of a set of brain networks, in the course of a predetermined cognitive task, a method implemented by way of an electronic device comprising means for obtaining data of encephalographic activities. Such a method comprises:- a step of obtaining (10) at least one time series of encephalographic activity data, according to a predetermined sampling value, said activity data being representative of a signal picked up at the cranial surface by at least one pickup device, during the execution of said predetermined cognitive task by at least one individual, step delivering a set comprising at least one vector of measurements per sample of the time series; - for each vector of measurements, a step of determining (20) a connectivity between cortical sources, said cortical sources being obtained on the basis of measurements of a measurement vector, delivering a connectivity network; - a step of grouping (30) the connectivity networks as a function of a resemblance parameter delivering a set of groups of grouped connectivity networks, each being representative, at a given instant, of an activity of a given brain network.
