Abstract (en)

An airway device includes a body fluid suction tube; a tracheal insertion tube to be passed through a trachea of a patient for sucking in a body fluid in the trachea of the patient; and an adaptor disposed at a base end portion of the tracheal insertion tube to be freely rotatable. The body fluid suction tube is arranged so that an opening portion thereof is situated inside relative to an opening portion of the tracheal insertion tube. The body fluid suction tube is arranged so that only the distal end portion thereof is urged against an inner surface of the tracheal insertion tube through an elastic force. The body fluid suction tube is arranged so that a lower side of an outer surface thereof is separated and is not closely contact with an upper side of the inner surface of the tracheal insertion tube.
