Abstract (en)

Scaffold clamping apparatus is provided including a first clamping element and at least a second clamping element. Each of said clamping elements has at least one clamping arm movable between a clamped position, whereon one or more items can be held in place between the clamping element in use, and an unclamped position, wherein one or more items can be located between and/or removed from the clamping element in use. The first and at least second clamping elements are arranged so as to allow relative pivotal and/or rotatable movement between the same. The first clamping element is offset from or non-aligned with the at least second clamping element.
