Abstract (en)

[origin: EP3323617A1] A method (400) for inspection of additive manufactured parts (140) and monitoring operational performance of an additive manufacturing apparatus (100) is provided. The method (400) includes a step of obtaining (430), in real-time during an additively manufactured build process, a backscatter x-ray scan of an area of a build platform (112). The build platform (112) is configured for supporting at least one part (140) during the build process. An evaluating step (440) evaluates, by a processor (602), the backscatter x-ray scan. A determining step (450) determines, based on the evaluating (440), whether an operational flaw with the additive manufacturing apparatus has occurred or a defect (201, 202, 203, 204, 205, 206) in the at least one part has occurred. A backscatter x-ray system (160) has an emitter (161) that emits x-rays and a detector (162) that receives backscattered x-rays. The emitter (161) and detector (162) are located on a movable support (163) located above the build platform (112), and the movable support (163) raises and lowers the emitter (161) and detector (162) with respect to the build platform (112).
