Abstract (en)

[origin: WO2017013057A1] The invention relates to an apparatus (1) for separating bulk material, in particular in the form of packages, from a bulk-material container, having a first belt conveyor (17) for conveying the bulk material moved onto the first belt conveyor from a bulk-material container (3), and having a second, downstream, belt conveyor (25), which is oriented at an angle about a vertical axis, preferably transversely, in relation to the conveying direction of the first belt conveyor (17) and is intended for removing the bulk material, wherein the first belt conveyor (17) has a plurality of separately activatable discharging conveying belts (17.1 - 17.10) arranged parallel to one another, and wherein the apparatus has an electronic control device (10), which is intended to drive the discharging conveying belts intermittently in each case such that components of the bulk material can be transferred to the second belt conveyor in each case at discrete times and/or distances.
