Abstract (en)
[origin: WO2017012721A1] The invention relates to a device for winding a screen (10) which comprises a tubular winder (12) defining a reference axis (100); a first wall fastener (18A) for attaching a first axial end portion (14A) of the tubular winder (12) to a first wall (16A), in an operational position of the screen-winding device (10); and a second wall fastener (18B) for attaching a second axial end portion (14B) of the tubular winder (12) to a second wall (16B), in the operational position of the screen-winding device (10). The first wall fastener (18A) comprises at least one tab (54) for attachment to the first wall (16A) and at least one first hinge (58) supported by the attachment tab (54) in order to guide a swivelling of the tubular winder (12) about a first hinge pin (200) which does not intersect the reference axis (100) and, in the operational position, is orthogonal to the reference axis (100). The first wall fastener (18A) can also comprise a second hinge (66) supported by the attachment tab (54) in order to guide the rotation of the first hinge (58) about a second hinge pin (300) which does not intersect the reference axis and is not parallel to the first hinge pin (200).
