Abstract (en)
Here it is described a process for realizing an exhibitor for artworks and/or documents of various types, and an exhibitor obtained thereby. The exhibitor is composed of a central rectangular and/or square flat element (17) and a plurality of perimeter closure elements, said element (17) being constituted by a transparent rectangular or square flat component (13), made of flexible transparent material such as for example a film, and divided into at least two parts equal to each other, which are coupled, and are suitable to contain in the interposed position between them the artwork and/or the document (16) to be displayed; said perimeter elements being constituted by strips, made of a rigid and lightweight material, such as for example polymer, or wood, or aluminium, and equal to each other in pairs, and provided on one of their side and for their entire length with at least one longitudinal groove, said strips being suitable to be joined each on a respective side of the perimeter (19) of the element (17), by accommodating by fixing joint such perimeter (19) in to said groove, in such a way that the ends of the strips might be coupled orthogonally with the ends of the strips, thus creating a robust rectangular or square frame, integral with the element (17).
