Abstract (en)

[origin: WO2017017374A1] The invention concerns an ophthalmic lens (1) that comprises a substrate (2) having a front main face (3) and a rear main face (4) and a photonic crystal layer (5) at least partially covering one of said main faces, and that has a spectral reflectivity curve for an incident angle on the front main face of between 0° and 45°, having a reflectivity peak with a maximum reflectivity value at a peak wavelength of between 420 and 450 nanometres, and a chroma value on reflection by the front main face with an incident angle of between 0° and 45° that is less than 30. The invention also concerns a method for producing such an ophthalmic lens.
