Abstract (en)

[origin: WO2017025483A1] The invention relates to an apparatus and a method for data capture of ambient data from an environment (12) of a user by means of a scene image recording device (16) and for evaluating the captured ambient data by means of an evaluation device (22). This involves making a spatial selection (36a, 36b, 36c) and/or temporal selection relating to a capture of the ambient data by means of the scene image recording device (16) and/or a transmission of the ambient data from the scene image recording device (16) to the evaluation device (22) and/or an evaluation of the ambient data by the evaluation device (22). Furthermore, the selection (36a, 36b, 36c) is made on the basis of at least one captured temporally variable first parameter (30, 32) in order to select said parameters with regard to their relevance, and hence to allow the volume of data to be reduced by reduction measures limited to less relevant data.
