Abstract (en)
[origin: WO2017025293A1] The invention relates to a control apparatus (1) for a battery-operated device, such as an operating table, comprising: at least two microprocessors (2, 3) for controlling components of the battery-operated device, at least one input device (8-11), which can send instructions to at least one of the microprocessors (2, 3) by means of an input channel, wherein a first microprocessor (2) is designed in such a way that the first microprocessor can be put into an idle state, in which the input channel of the input device (8-11) is monitored, while the second microprocessor (3) is switched off, wherein the first microprocessor (2) is furthermore designed in such a way that the first microprocessor first puts itself into an active state and then puts the second microprocessor (3) into an active state when an instruction is input by the input device (8-11).
