Abstract (en)

[origin: EP3332659A1] A button and buttonhole structure is configured so that parts linking each of a pair of buttons and a section of fabric on one side are positioned at the distal ends or proximal ends of a pair of buttonholes provided to a section of fabric on the other side. Therefore, when the buttons are buttoned, it is possible to have the buttons move less, relative to the buttonholes, than in the past, and the buttons can stay buttoned more stably. As a result, the buttons are less likely to come undone inadvertently, and increasing the size of the buttonholes facilitates buttoning and unbuttoning of the buttons.
