Abstract (en)
[origin: WO2017029439A1] The invention relates to a lifting anchor for a structural member, such as a concrete panel, comprising a head part able to be coupled with a gripping ring, a foot and a body interposed between the head and the foot, the head and the foot being intended to be embedded in the material of which the structural member is made, the anchor being obtained by folding at least one flat defining different successive portions that form the head, the body and the foot, respectively, of the anchor, the constituent portions of the foot of the anchor comprising two lower branches that diverge on either side of the body of the anchor. According to the invention, the anchor comprises a reinforcing part (20) interposed between the two flats or flat portions, extending from the head of the anchor along at least a part of the body.
