Abstract (en)

The invention relates to a closure for containers for liquids, with discharge adjustment, said closure comprising three bodies, a lower body, an intermediate body and an upper body, which are independently moulded and pressed together, characterised in that the lower body comprises means for joining to the neck of the container, windows arranged in a fixed position for the passage of the liquid, means for joining to the upper body, and means for joining to the intermediate body, said intermediate body comprising a detachable safety membrane, and conical-radial projections extending below said membrane and in the opposite direction to that of the outflow of the liquid, cooperating with the fixed windows in order to regulate the flow quantity, said projections being deformable and not joined at the centre thereof, the intermediate body being able to turn in relation to the lower body, and said upper body comprising a detachable strip that seals a cover.
